Hiring Manager

Subject: Application for Analyst - Machine Learning, Python

Dear Hiring Manager,

I am applying for the Analyst - Machine Learning, Python role because it sits exactly at the intersection of data analysis, model validation, and applied machine learning that I enjoy most. I am a final-year IT student at NIT Raipur and currently an AI Developer Engineer Intern at CredResolve, where I build production-focused AI systems for real customer workflows.

At CredResolve, I work on Python-first ML systems where accuracy and reliability directly affect outcomes. My work involves analyzing model behavior, investigating failure patterns, validating outputs, and improving systems based on data-backed findings. That has given me hands-on exposure to the analytical and detail-oriented work this role demands.

I also bring strong project experience across ML and data workflows. I built a delivery time prediction system with around 3.1-minute MAE, developed a medical RAG chatbot over user documents, and worked on deep learning projects using PyTorch, scikit-learn, and SQL. These experiences strengthened my ability to work with datasets, measure model performance, and turn analysis into practical improvements.

What I would bring to your team is a combination of strong ML fundamentals, execution speed, and a builder mindset. I enjoy working through ambiguous problems, validating results carefully, and communicating findings clearly. I would value the opportunity to contribute to machine learning solutions that are accurate, reliable, and aligned with business goals.

Thank you for your time and consideration.

Sincerely,

Aditya Meshram
